

greenEvolution

# One system for all possibilities

**Diverse. Optimised. Individual.**

# Our guiding sustainability principles

greenEvolution is our profile system for all conceivable options. It allows flexible adaptation to contemporary needs by achieving a high degree of compatibility with all requirements in new build and renovation. With different design options in the casement as well as realMaterial surfaces, all possible styles can be realised: from classic purist to conspicuously modern.

With a large number of profile systems there are virtually no limits to the imagination, even for individual window shapes. Adapting to the increasing demand in the renovation segment is part of our sustainability strategy: maintain what is good and therefore minimise CO<sup>2</sup> emissions.

This approach is supported by our basic principles: only use as much material as is necessary for a technically faultless solution, maximum the proportion of recycled material and at the same time be 100% recyclable.

# SALAMANDER

WINDOW & DOOR SYSTEMS

## free

Minimum visible frame heights for maximum light input and solar energy inputs with simultaneously reduced design

## curve

Round design with harmonious look and the feeling of harmony and balanced proportions

## box

Angular flush-mount design with clear lines and many glazing options through to 56 mm

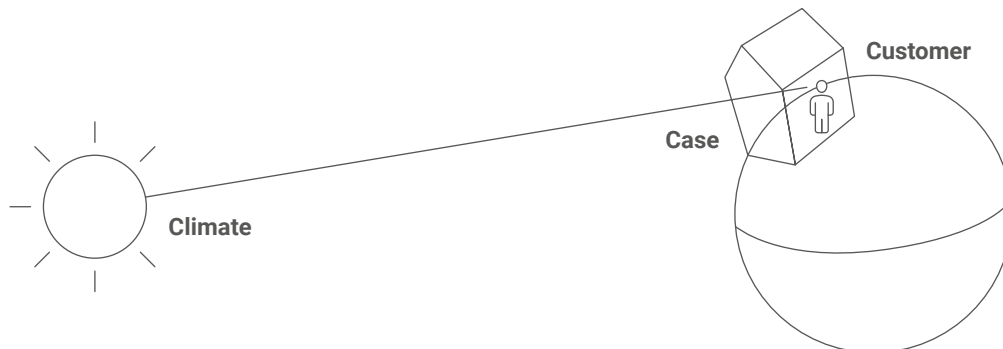

## flex

Classic design, which can be used universally, with a high degree of functionality and energy efficiency

# The myWindow strategy:

## How does a window become myWindow?

Every building is a unique system due to its geosition, orientation, the year it was built and the architectural style. That also requires a unique window. With myWindow, Salamander helps you, as the client or owner to find the perfect window.

**The C3 explanatory principle is at the core of this:**

**Climate** – describes the potential of the location (light, energy, insulation)

**Case** – the building type is the blueprint for use of the potential

**Customer** – individual ideas determine design and specific configuration

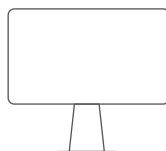

In the myWindow\_app you can analyse your project in the C3 dimensions. We help you, fact based and on the basis of the calculation of the Passivhaus Institute, to find the optimum solution and to configure it according to your requirements.

Very good insulation values achieved through modern product design form the basis of being able to deal with the climatic requirements. The large number of depictable designs and associated style and visible frame heights allow optimum adaptation to location requirements. Whether the number of casements, a round frame profile or an angular one after all - your ideas can be easily implemented in reality, regardless of whether for a new build project or the renovation of an old building.

## Our new digital tools support you, step by step, in the selection of your perfect window solution.
